

Acme Product Roadmap

Fiscal Year 2024 Planning Document — Product Organization

Overview

The 2024 product roadmap focuses on three strategic pillars: AI-native workflows, enterprise readiness, and platform extensibility. This document outlines commitments, timelines, and success metrics for each pillar.

Pillar 1 — AI-Native Workflows

Acme Assistant GA

The Acme Assistant reaches general availability in Q2 2024. The Assistant provides natural-language querying over customer data, automated summarization of reports, and inline recommendations. Key capabilities include multi-turn context, citation of source documents, and role-based access controls.

Semantic Search

Semantic search over documents, tickets, and customer records ships in Q1. The system uses a hybrid retrieval pipeline combining dense vector search with BM25 lexical ranking via reciprocal rank fusion. A cross-encoder reranker provides final precision.

Pillar 2 — Enterprise Readiness

SSO and SCIM

Full support for SAML 2.0 and OIDC SSO providers ships in Q1. SCIM provisioning for Okta, Azure AD, and Google Workspace ships in Q2.

Audit Logs

Comprehensive audit logging ships in Q2. Logs are exportable via API and streamable to customer SIEM systems via webhook.

Data Residency

Data residency options for EU and APAC customers ship in Q3. Customers may select their primary region at onboarding.

Pillar 3 — Platform Extensibility

Public API v2

A redesigned public API ships in Q2. The new API uses REST for CRUD operations and GraphQL for complex queries. Rate limits increase to 10,000 requests per minute per tenant.

Webhooks and Events

A webhook system for real-time event delivery ships in Q3. Events include `document.created`, `comment.added`, and `workflow.completed`.

Out of Scope for 2024

The following items are explicitly out of scope for 2024: on-premise deployment, mobile native apps, real-time collaborative editing, and custom model training for customers.
